

Four-link comparison under the shared V22_3/V9 evaluator

a Decision persistence

Mechanism schematic; not rollout data

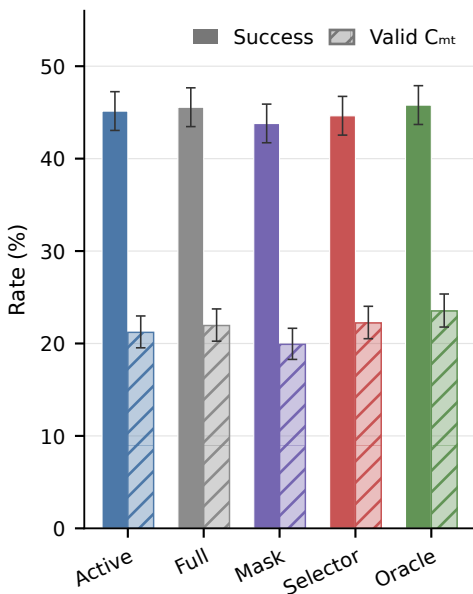

True per-step hard mask

Every step: $s[t] \rightarrow z[t]$ in $\{-1, +1\}$
 $A(z[t])$: hip sign in $\{0, z[t]\}$; knees 3×3
 18/27 actions; $z[t]$ may change at $t + 1$

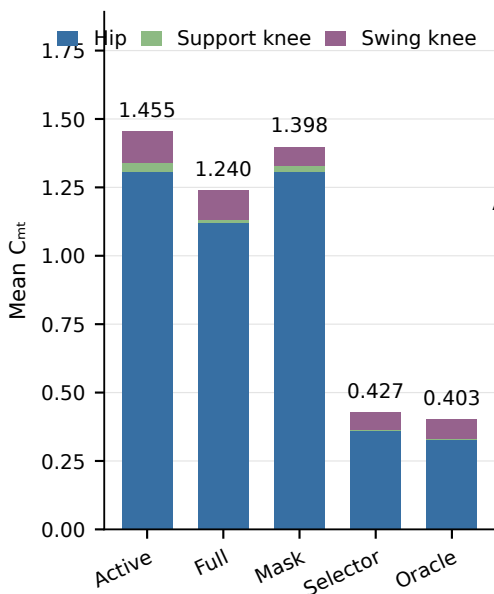

Transition-persistent selector

Transition start: $s_0 \rightarrow z = \text{pi_sel}(s_0)$
 $A(z)$: hip sign in $\{0, z\}$; knees 3×3
 18 actions; the same z until termination

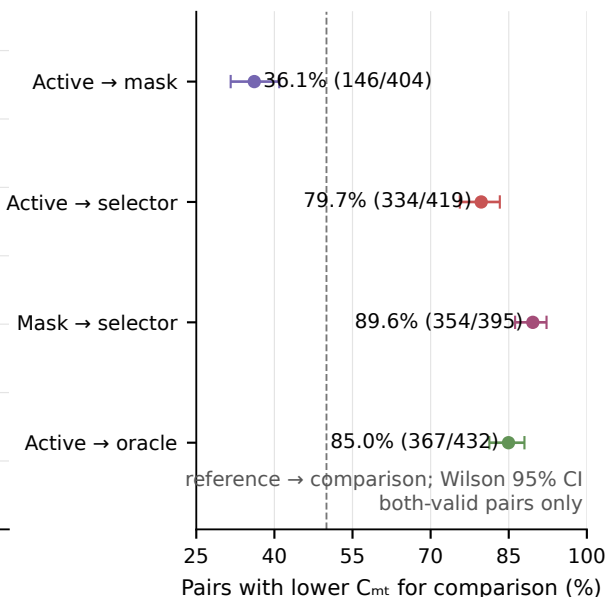

b Success and valid- C_{mt} n = 2160 each; Wilson 95% CI

c Valid-transition C_{mt} by joint controller-specific valid sets

d Paired lower- C_{mt} fraction

Fixed-checkpoint result: the selector's low- C_{mt} pattern was not reproduced by the scratch hard mask. This is not a strict one-factor causal test.
